

NLPCC 2026

Shared Tasks

The 15th CCF International Conference on Natural Language Processing and Chinese Computing

[Overview](#)

[How to Participate](#)

[Important Dates](#)

[Paper Submission](#)

[Organizers](#)

NLPCC 2026 continues the tradition of previous NLPCC conferences by hosting a series of shared tasks in natural language processing and Chinese computing. This year's shared tasks cover both established research problems and emerging challenges.

Participants from both academia and industry are welcome. Each team may participate in one or more tasks. Participants will also be invited to submit papers to the main conference, and accepted papers will appear in the conference proceedings.

The top three teams in each task will receive certificates jointly issued by NLPCC and CCF-NLP. If a task contains multiple sub-tasks or tracks, only the top-ranked team in each sub-task or track will receive a certificate.

Registration Deadline: May 25th, 2026

Overview of the Shared Tasks

There are eleven shared tasks in NLPCC 2026. A brief overview of each task is given below.

DA-MIVQA extends the medical instructional video question answering tasks held at NLPCC from 2023 to 2025 by introducing difficulty-aware evaluation. Rather than measuring only overall performance, the new benchmark explicitly distinguishes between simple questions, which can be answered primarily through direct subtitle-aligned evidence, and complex questions, which require the integration of subtitles, visual demonstrations, and procedural context. This design aims to better assess model robustness in realistic medical education and emergency knowledge-access scenarios.

Tracks:

- Difficulty-Aware Temporal Answer Grounding in Single Video (DA-TAGSV)
- Difficulty-Aware Video Corpus Retrieval (DA-VCR)
- Difficulty-Aware Temporal Answer Grounding in Video Corpus (DA-TAGVC)

 **Organizers:** Shenzhen Institutes of Advanced Technology; School of Computer Science and Technology, Beijing Institute of Technology

 **Contacts:** Shenxi LIU (liushenxi@foxmail.com), Bin LI (b.li2@siat.ac.cn), Kan LI (likan@bit.edu.cn), Mingyang ZHAO (25019897r@connect.polyu.hk), Yuhang TIAN

2 Schwartz's Basic Human Values' Detection and Alignment with LLMs

LLM alignment has advanced rapidly in recent years. With the large-scale deployment of large language models in areas such as education, healthcare, psychological counseling, and public services, fine-grained value alignment has become an important prerequisite for safe and reliable AI systems. Existing studies often focus on coarse-grained compliance and bottom-line risk control, while systematic research on psychological basic human values remains limited. This shared task provides a standardized dataset based on Schwartz's theory of 19 basic human values and existing psychological test questions to support research on fine-grained value detection and alignment in LLMs.

 Website: <https://github.com/ctge5/SVDA>

Identify the dominant value in the text.

- **Track 2: Response Generation of Specific Human Value** — Given an input question and a target value, the model is required to generate a valid response that aligns with the specified human value while maintaining content validity.

 **Organizers:** Zhengzhou University

 **Contacts:** Changtong GE (gee5@qq.com), Hongfei XU (hfxunlp@foxmail.com), Zhipeng LI, Xinglin LYU, Lingling MU

3 The Multi-dimensional Evaluation of Traditional Chinese Medicine LLMs: Capability, Reliability, and Robustness

While large language models have shown strong performance on knowledge-intensive benchmarks, existing evaluations of Traditional Chinese Medicine (TCM) LLMs largely focus on core domain knowledge and overlook reliability and robustness under perturbed question formats. This shared task introduces a multi-dimensional evaluation framework built from authoritative undergraduate textbook exercises to jointly assess capability, reliability, and robustness through question answering, statement verification, and format-perturbed inputs. The task aims to move beyond accuracy-centric evaluation and provide a more faithful assessment of how well TCM knowledge is internalized by the models.

 **Organizers:** National Supercomputer Center in Tianjin; Tianjin University of Traditional Chinese Medicine

 **Contacts:** Chuang LIU (liuchuang@nsc-tj.cn), Xiangfei MENG, Pengfei NIE, Ruizheng XIAO, Zhe CHEN, Zhaochen JI

4 LLM-based Investment Advisor Agents for Asset Allocation in the Chinese Market

This task evaluates the ability of LLM-based investment advisor agents to perform complex reasoning and quantitative decision-making in the Chinese

a backtesting environment, the agents are provided with a top-20 Financial Hot News feed and historical price data, and must autonomously generate daily rebalancing instructions for designated ETF pools.

🌐 Website: <https://github.com/splash-li/NLPCC2026-Shared-Task-4/>

Tracks:

- Track 1: Macro-Asset Allocation — This track evaluates macro-inference capabilities by rebalancing macro-category ETFs such as broad indices, treasury bonds, and gold to navigate economic cycles.
- Track 2: Sector-Rotation Allocation — This track focuses on sensitivity to industrial policies and trends, requiring tactical adjustments across industry-themed ETFs such as new energy, semiconductors, and healthcare.

👥 **Organizers:** E Fund Management Co., Ltd.; Tsinghua University; Peking University; Wuhan University; The Hong Kong University of Science and Technology (Guangzhou); The Hong Kong Polytechnic University

✉ **Contacts:** Liyuan CHEN, Shuoling LIU, Xi CHENG, Jianqiu DENG, Jiangpeng YAN (yanjiangpeng@efunds.com.cn), Shilong LI (lishilong@efunds.com.cn), Jian LI, Li YUAN, Qianqian XIE, Nan TANG, Yang LIU

5 Chinese BabyLM: Data-Efficient and Developmentally Plausible Language Models for Chinese

Large language models achieve remarkable performance by training on trillions of words, yet human children acquire robust linguistic competence from far less input. Inspired by the BabyLM Challenge, Chinese BabyLM is the first shared task dedicated to sample-efficient pretraining for Chinese. Participants train language models on a constrained corpus of approximately 100 million words of developmentally plausible Chinese text, including children's storybooks, child-adult conversations, and movie subtitles.

🌐 Website: <https://chinese-babylm.github.io/>

Tracks:

- Track 1: Natural Language Understanding (NLU) — This track evaluates syntactic and semantic understanding using Chinese benchmarks.

character phonology and orthography.

 **Organizers:** Hai HU, Siyuan SONG, Linyang HE, Shaonan WANG, Yunhao ZHANG, Rui WANG, Luan LI, Hong'ao ZHU, Xiaozhe JI, Yingxin LIN

 **Contacts:** Hai HU (hu.hai@cityu.edu.hk), Siyuan SONG (siyuansong@utexas.edu), Shaonan WANG (shaonan.wang@polyu.edu.hk)

6 The 2nd Shared Task on LLM-Generated Text Detection

The rapid development of large language models has introduced serious challenges, including disinformation generation, harmful content dissemination, and misuse. Against this backdrop, efficiently distinguishing LLM-generated text from human-written text has become an urgent research problem. Following the success of the first shared task at NLPCC 2025, the 2026 edition extends the task from binary classification to ternary classification by distinguishing among human-written text, LLM-generated text, and LLM-refined text. This setting better reflects real-world use cases and aims to advance robust Chinese LLM-generated text detection.

 Website: <https://nlp2ct.github.io/NLPCC-2026-Task6-Detection/>

 **Organizers:** NLP2CT Lab, University of Macau; Alibaba Cloud; Central China Normal University

 **Contacts:** Junchao WU (nlp2ct.junchao@gmail.com), Derek F. WONG, Runzhe ZHAN, Zeyu WU, Zhiwen XIE, Yichao DU, Longyue WANG

7 ELSSTBenchmark: A Joint Evaluation of Implicit Concept Retrieval and Knowledge Discovery for LLMs

This shared task evaluates large language models on identifying implicit social-science concepts from long English texts. Given a 600–900-word English document written in a “show, don’t tell” style, where target concepts are implied through situations and narratives rather than explicitly named, participating systems may enter one or both independent tracks.

- **Track 2: Knowledge Discovery Generation** — Systems are asked to discover and generate the implicit concepts in the text without access to the concept pool.

 **Organizers:** University of Surrey; NYU Shanghai

 **Contacts:** Zeqiang WANG (zeqiang.wang@surrey.ac.uk), Suparna DE, Zixi CHEN

8 **Factivity Inference Inconsistency Attack (FIIA)**

Factivity Inference (FI) is an important semantic understanding task concerned with the truthfulness of events. Although accurate access to factual information is crucial for large language models, existing models often exhibit instability in FI when subjected to minor textual perturbations or complex contexts. This shared task adopts a red-teaming setting to systematically expose the boundaries and vulnerable scenarios of current LLMs in complex FI tasks. Participants are required to creatively adapt the provided Chinese FI dataset to induce hallucinations or trigger inconsistency in model judgments.

Tracks:

- **Track 1:** The attack target is a designated Qwen model.
- **Track 2:** The attack target is a designated DeepSeek model.

 **Organizers:** Huazhong University of Science and Technology; University of Macau; Nanjing Normal University

 **Contacts:** Daohuan LIU (liudh@hust.edu.cn), Xuri TANG (xrtang@hust.edu.cn), Yulin YUAN (yulinyuan@um.edu.mo), Bin LI, Guanliang CONG, Junchao WU

9 **AISB (AI Scientist Benchmark)**

AISB (AI Scientist Benchmark) evaluates the capability of AI systems to conduct scientific research autonomously. Given a research topic, reference papers, and established benchmarks with known baselines, participating AI Scientist systems must independently read the literature, formulate hypotheses, design

Tracks:

- Track 1: Scientific Research — The AI system is given a research topic, reference papers, and a benchmark, and must autonomously conduct a full research cycle, including hypothesis formulation, experimental design, ablation studies, result analysis, and paper writing in ICLR format.
- Track 2: Benchmark SOTA Challenge — The AI system is given a benchmark with known SOTA baselines and must develop a new method that improves over the current SOTA, provide analysis, and produce a technical report in ICLR format.

 **Organizers:** WestLakeNLP, Westlake University

 **Contacts:** Qiyao SUN (sunjoey035@gmail.com), Yue ZHANG

10 Reliability of AI-Assisted Scientific Reporting

As generative AI and agentic AI become increasingly integrated into scientific workflows, they are now widely used to assist with scientific writing, including summarizing experimental results, drafting conclusions, and generating citation-supported statements. However, recent studies have shown that AI-assisted scientific reporting often overgeneralizes conclusions beyond what the source evidence justifies. This shared task focuses on determining whether an AI-generated scientific statement faithfully reflects the evidence it summarizes or cites.

 Website: <https://nlp2ct.github.io/NLPCC-2026-Task10-Science/>

Tracks:

- Track 1: Claim-level faithfulness to experimental results — Systems determine whether each sentence in an AI-generated claim paragraph is supported by the provided experimental evidence.
- Track 2: Citation-level faithfulness to external evidence — Systems determine whether an AI-generated scientific claim is genuinely supported by the cited paper and identify the supporting evidence paragraphs.

 **Organizers:** University of Macau

11 Agent-Based Experiment Reproduction from Scientific Papers

As LLM-based AI systems become increasingly integral to scientific workflows, they provide substantial support across multiple stages of research. However, experiment reproduction remains a significant challenge for current AI agents. This task evaluates agents' ability to reconstruct experimental pipelines from research papers by interpreting text, planning implementations, generating code, and executing experiments within a controlled environment. Unlike prior work that focuses only on final outputs, this task emphasizes the full reproduction process through fine-grained action logs and predefined rubrics covering key stages such as paper understanding, planning, coding, and execution.

 **Organizers:** The University of Manchester; Beihang University; Langboat

 **Contacts:** Hanhua HONG (hanhua.hong@postgrad.manchester.ac.uk), Yizhi LI, Jian YANG, Ming ZHOU, Chenghua LIN

How to Participate

1 The 4th Multilingual and Multimodal Medical Instructional Video Understanding Evaluation: Difficulty-Aware Challenge

Please fill out the Shared Task 1 Registration Form (Word File) and send it to the registration email.

Registration Form

 Registration Email

2 Schwartz's Basic Human Values' Detection and Alignment with LLMs

Please fill out the Shared Task 2 Registration Form (Word File) and send it to the registration email.

3 The Multi-dimensional Evaluation of Traditional Chinese Medicine LLMs: Capability, Reliability, and Robustness

Please fill out the Shared Task 3 Registration Form (Word File) and send it to the registration email.

Registration Form

 Registration Email

4 LLM-based Investment Advisor Agents for Asset Allocation in the Chinese Market

Please fill out the Shared Task 4 Registration Form (Word File) and send it to the registration email.

Registration Form

 Registration Email

5 Chinese BabyLM: Data-Efficient and Developmentally Plausible Language Models for Chinese

Please fill out the Shared Task 5 Registration Form (Word File) and send it to the registration email.

Registration Form

 Registration Email

6 The 2nd Shared Task on LLM-Generated Text Detection

Please fill out the online registration form using the link above.

Online Registration Form

 Registration Email

Please fill out the Shared Task 7 Registration Form (Word File) and send it to the registration email. The suggested email subject is "[NLPCC 2026 Shared Task Registration] Team Name".

Registration Form

✉ Registration Email

8 **Factivity Inference Inconsistency Attack (FIIA)**

Please fill out the Shared Task 8 Registration Form (Word File) and send it to the registration email.

Registration Form

✉ Registration Email

9 **AISB (AI Scientist Benchmark)**

Please complete registration via the online form or email the Shared Task 9 Registration Form (Word File). The Data Usage Agreement is available in the registration form. Task guidelines and data will be released on April 15, 2026.

Registration Form

Online Registration Form

✉ Registration Email

10 **Reliability of AI-Assisted Scientific Reporting**

Please fill out the online registration form using the link above, or send your team information to the registration email.

Online Registration Form

11 **Agent-Based Experiment Reproduction from Scientific Papers**

Important Dates

 March 20, 2026	Announcement of shared tasks and call for participation; registration open
 April 15, 2026	Release of detailed task guidelines and training data
 May 25, 2026	Registration deadline
 June 11, 2026	Release of test data
 June 20, 2026	Participants' results submission deadline
 June 30, 2026	Evaluation results release and call for system reports and conference paper

Paper Submission Guidelines

The evaluation papers are English only. The papers will appear in the proceedings of the NLPCC 2026 conference (for English), which are expected to be published in the Springer LNAI series. Submissions should follow the LNCS formatting instructions. The maximum length for papers is 12 pages, including references and appendices.

Submissions must adhere to the standard Springer style sheets (LaTeX or Microsoft Word). All papers should be prepared in PDF format.

Shared Task Organizers (in Alphabetical Order)

Liyuan CHEN, E Fund Management Co., Ltd.

Zhe CHEN, Tianjin University of Traditional Chinese Medicine

Zixi CHEN, NYU Shanghai

Xi CHENG, E Fund Management Co., Ltd.

Guanliang CONG, University of Macau

Suparna DE, University of Surrey

Jianqiu DENG, E Fund Management Co., Ltd.

Yichao DU, Alibaba Cloud

Changtong GE, Zhengzhou University

Linyang HE, Columbia University

Hanhua HONG, The University of Manchester

Hai HU, City University of Hong Kong

Xiaozhe JI, Beijing Normal University

Zhaochen JI, Tianjin University of Traditional Chinese Medicine

Bin LI, Nanjing Normal University

Bin LI, Shenzhen Institute of Advanced Technology, Chinese Academy of Sciences

Jian LI, Tsinghua University

Kan LI, Beijing Institute of Technology

Luan LI, Shanghai Jiao Tong University

Shilong LI, E Fund Management Co., Ltd.

Yizhi LI, The University of Manchester

Zhipeng LI, Zhengzhou University

Chenghua LIN, The University of Manchester

Yingxin LIN, Tsinghua University

Chuang LIU, National Supercomputer Center in Tianjin

Daohuan LIU, Huazhong University of Science and Technology

Shenxi LIU, Beijing Institute of Technology

Shuoling LIU, E Fund Management Co., Ltd.

Yang LIU, The Hong Kong Polytechnic University

Xinglin LYU, Zhengzhou University

Jingkun MA, University of Macau

Xiangfei MENG, National Supercomputer Center in Tianjin

Siyuan SONG, The University of Texas at Austin

Qiyao SUN, Westlake University

Yanming SUN, University of Macau

Nan TANG, The Hong Kong University of Science and Technology (Guangzhou)

Xuri TANG, Huazhong University of Science and Technology

Yuhang TIAN, Beijing Institute of Technology

Longyue WANG, Alibaba Cloud

Rui WANG, Shanghai Jiao Tong University

Shaonan WANG, The Hong Kong Polytechnic University

Zejiang WANG, University of Surrey

Derek F. WONG, University of Macau

Junchao WU, University of Macau

Zeyu WU, University of Macau

Zhiwen XIE, University of Macau / Central China Normal University

Hongfei XU, Zhengzhou University

Jiangpeng YAN, E Fund Management Co., Ltd.

Jian YANG, Beihang University

Yutong YAO, University of Macau

Fengying YE, University of Macau

Li YUAN, Peking University

Yulin YUAN, University of Macau

Runzhe ZHAN, University of Macau

Yue ZHANG, Westlake University

Yunhao ZHANG, Chinese Academy of Sciences

Mingyang ZHAO, The Hong Kong Polytechnic University

Ming ZHOU, Langboat

Hong'ao ZHU, University of California San Diego
